01.

Sol:

$\Rightarrow D_{1}, D_{2}$ are reverse biased and $D_{3}$ is forward biased.
i.e., $\mathrm{D}_{3}$ only conducts.
$\therefore \mathrm{I}_{0}=3 / 5 \mathrm{~K}=0.6 \mathrm{~mA}$
02.

Sol:

$\Rightarrow D_{2} \& D_{3}$ are reverse biased and ' $D_{1}$ ' is forward biased.
i.e., $\mathrm{D}_{1}$ only conduct
$\therefore \mathrm{I}_{0}=\frac{5-1}{5 \mathrm{~K}}=0.8 \mathrm{~mA}$
03.

Sol: Let diodes $\mathrm{D}_{1} \& \mathrm{D}_{2}$ are forward biased.
$\Rightarrow \mathrm{V}_{0}=0$ volt
$\mathrm{I}_{2}=\frac{10-0}{5 \mathrm{~K}}=2 \mathrm{~mA}$
$\mathrm{I}_{3}=\frac{0-(-10)}{10 \mathrm{~K}}=1 \mathrm{~mA}$
Apply KVL at nodes ' $\mathrm{V}_{0}$ ':
$-\mathrm{I}_{1}+\mathrm{I}_{3}-\mathrm{I}_{2}=0$
$\Rightarrow \mathrm{I}_{1}=-\left(\mathrm{I}_{2}-\mathrm{I}_{3}\right)=-1 \mathrm{~mA}$

So, $D_{1}$ is reverse biased \& $D_{2}$ is forward biased
$\Rightarrow{ }^{`} D_{1}{ }^{\prime}$ act as an open circuit \& $D_{2}$ is act as short circuit.

Then circuit becomes

$\Rightarrow \mathrm{V}_{0}=10 \mathrm{k} \times\left(\frac{20}{15 \mathrm{k}}\right)-10$
$\therefore \mathrm{V}_{0}=3.33 \mathrm{~V}$
04.

Sol:

Apply KVL to the loop:
$\mathrm{V}_{\mathrm{in}}-2-\mathrm{V}_{\mathrm{x}}=0$
$\Rightarrow V_{x}=V_{\text {in }}-2$
Given, $\mathrm{V}_{\text {in }}$ range $=-5 \mathrm{~V}$ to 5 V
$\Rightarrow \mathrm{V}_{\mathrm{x}}$ range $=-7 \mathrm{~V}$ to 3 V
$[\because$ from eq $(1)]$
Diode ON for $\mathrm{V}_{\mathrm{x}}>0 \mathrm{~V}$
$\Rightarrow V_{0}=V_{x}$
Diode OFF for $\mathrm{V}_{\mathrm{x}}<0 \mathrm{~V}$
$\Rightarrow \mathrm{V}_{0}=0 \mathrm{~V}$
$\therefore \mathrm{V}_{0}$ range $=0$ to 3 V

05.

Sol:

For $\mathrm{V}_{\mathrm{i}}<-2$ Volt, Diode ON
$\Rightarrow \mathrm{V}_{0}=-2$ Volt
For $\mathrm{V}_{\mathrm{i}}>-2$ Volt, Diode OFF
$\Rightarrow \mathrm{V}_{0}=\mathrm{V}_{\mathrm{i}}$

06. Ans: (a \& c)

Sol: In positive half, of input $\rightarrow$

Capacitor $\mathrm{C}_{1}$ is charging so, $\underset{\text { Char }}{T}=\mathrm{R}_{\mathrm{F}_{1}} \mathrm{C}_{1}=0$

For $\theta \rightarrow$ Range from $0 \rightarrow \frac{\pi}{2}$,

Now at $\theta=\frac{\pi}{2}, V_{\mathrm{C}_{1}}=\mathrm{V}_{\mathrm{m}}$
$\mathrm{D}_{1} \& \mathrm{D}_{2}$ both are OFF

So, $\mathrm{C}_{1}$ has no discharging path $\Rightarrow$ steady state,
So, at steady state $\mathrm{V}_{\mathrm{C}_{1}}=+\mathrm{V}_{\mathrm{m}}=+5 \mathrm{~V}$.
Since in ANALOG circuit, for either clampers (or) for Ripple removal shunt capacitor filter,
$\mathrm{T}_{\text {discharge }} \ggg \mathrm{T}$, where $\mathrm{T} \rightarrow$ Time period.
Now for $\theta>\frac{\pi}{2}, \mathrm{~V}_{\mathrm{C}_{1}}=\mathrm{V}_{\mathrm{m}}>\mathrm{V}_{\mathrm{i}}$
$\Rightarrow$ Due to $\mathrm{V}_{\mathrm{C}_{1}}, \mathrm{D}_{1}$ is OFF
$\mathrm{D}_{2}$ is ON
Now circuit is $\rightarrow$

Now, $\mathrm{V}_{\mathrm{i}}=\mathrm{V}_{\mathrm{C}_{1}}-\mathrm{V}_{\mathrm{C}_{2}} \Rightarrow \mathrm{~V}_{\mathrm{C}_{2}}=\mathrm{V}_{\mathrm{C}_{1}}-\mathrm{V}_{\mathrm{i}}$
Now, at $\theta=\frac{3 \pi}{2}, \mathrm{~V}_{\mathrm{i}}=-\mathrm{V}_{\mathrm{m}}$

$$
\Rightarrow \mathrm{V}_{\mathrm{C}_{2}}=2 \mathrm{~V}_{\mathrm{m}}=10 \mathrm{~V}
$$

Now, at $\theta=\frac{3 \pi}{2}, \mathrm{~V}_{\mathrm{C}_{1}}=5 \mathrm{~V}$ from the circuit such that, $\mathrm{V}_{\mathrm{C}_{2}}=10 \mathrm{~V}$
Due to $\mathrm{V}_{\mathrm{C}_{2}}, \mathrm{D}_{2}$ act as open circuit
So, at $\theta=\frac{3 \pi}{2}$, the circuit looks like $\rightarrow$

Now, as no discharge path for $\mathrm{C}_{1} \& \mathrm{C}_{2}$

$$
\Rightarrow \text { Steady state }
$$

So, at steady state, $\mathrm{V}_{\mathrm{C}_{2}}=10 \mathrm{~V}$, but form circuit $\mathrm{V}_{\mathrm{C}_{2}}$ polarity is opposite

$$
\Rightarrow \mathrm{V}_{\mathrm{C}_{2}}=-10 \mathrm{~V}
$$

So, options (a) \& (c) are correct.
07.

Sol: For positive half cycle diode Forward biased and Capacitor start charging towards peak value.

$$
\begin{aligned}
& \Rightarrow \mathrm{V}_{\mathrm{C}}=\mathrm{V}_{\mathrm{m}}=5 \mathrm{~V} \\
& \Rightarrow \mathrm{~V}_{0}=\mathrm{V}_{\text {in }}-\mathrm{V}_{\mathrm{C}}=\mathrm{V}_{\text {in }}-5 \\
& \mathrm{~V}_{\text {in }} \text { range }=-5 \mathrm{~V} \text { to }+5 \mathrm{~V} \\
& \therefore \mathrm{~V}_{0} \text { range }=-10 \mathrm{~V} \text { to } 0 \mathrm{~V}
\end{aligned}
$$

8. 

Sol: For +ve cycle, diode ' ON ', then capacitor starts charging
$\Rightarrow \mathrm{V}_{\mathrm{C}}=\mathrm{V}_{\mathrm{m}}-7=10-7=3 \mathrm{~V}$

Now diode OFF for rest of cycle

$$
\begin{aligned}
\Rightarrow \mathrm{V}_{0} & =-\mathrm{V}_{\mathrm{C}}+\mathrm{V}_{\text {in }} \\
& =\mathrm{V}_{\mathrm{in}}-3
\end{aligned}
$$

$\mathrm{V}_{\text {in }}$ range $:-10 \mathrm{~V}$ to +10 V
$\therefore \mathrm{V}_{0}$ range: -13 V to 7 V

09.

Sol: Always start the analysis of clamping circuit with that part of the cycle that will forward bias the diodes this diode is forward bias during negative cycle.

For negative cycle diode ON, then capacitor starts charging

$$
\begin{aligned}
\Rightarrow V_{C} & =V_{P}+9 \\
& =12+9=21 \mathrm{~V}
\end{aligned}
$$

Now diode OFF for rest of cycle.

$$
\begin{aligned}
\Rightarrow \mathrm{V}_{0} & =\mathrm{V}_{\mathrm{C}}+\mathrm{V}_{\text {in }} \\
& =21+\mathrm{V}_{\text {in }}
\end{aligned}
$$

$\mathrm{V}_{\text {in }}$ range: -12 to +12 V
$\mathrm{V}_{0}$ range: 9 V to 33 V

10.

Sol: During positive cycle,
$\mathrm{D}_{1}$ forward biased \& $\mathrm{D}_{2}$ Reverse biased.

During negative cycle,
$\mathrm{D}_{1}$ reverse biased \& $\mathrm{D}_{2}$ forward biased.

Capacitor $\mathrm{C}_{2}$ will charge to negative voltage of magnitude 12 V

$$

$\Rightarrow \mathrm{I}_{\mathrm{Z}}=\mathrm{I}_{\mathrm{S}}-\mathrm{I}_{\mathrm{L}}$
$\Rightarrow I_{Z_{\text {min }}}=I_{S}-I_{L_{\text {max }}}$
$\because$ Zener diode is ideal, $\mathrm{I}_{\mathrm{Z}_{\text {min }}}=0 \ldots \ldots$...(
$\therefore \mathrm{I}_{\mathrm{S}}=\mathrm{I}_{\mathrm{L}_{\max }}=200 \mathrm{~mA}$
Step-2: KVL for input loop

$$
\begin{equation*}
\mathrm{R}_{\mathrm{S}}=\frac{16 \mathrm{~V}-12 \mathrm{~V}}{200 \mathrm{~mA}}=20 \Omega \tag{6}
\end{equation*}
$$

$\qquad$

Step-3: From equation (2),

$$
\begin{aligned}
\mathrm{I}_{\mathrm{Z}_{\max }}=\mathrm{I}_{\mathrm{S}}-\mathrm{I}_{\mathrm{L}_{\text {min }}} & =200 \mathrm{~mA} \ldots \\
\Rightarrow \mathrm{P}_{\mathrm{Z}_{\max }}=\mathrm{V}_{\mathrm{Z}} \mathrm{I}_{\mathrm{Z}_{\max }} & =12 \times 200 \mathrm{~mA} \\
& =2.4 \mathrm{Watts}
\end{aligned}
$$

$\therefore$ For satisfactory voltage regulation in the circuit, the power rating of zener diode should be more than 2.4 Watts.

## 60. Ans: (c)

Sol: The circuit given is the MOS cascode amplifier, Transistor $\mathrm{M}_{1}$ is connected in common source configuration and provides its output to the input terminals (i.e., source) of transistor $\mathrm{M}_{2}$. Transistor $\mathrm{M}_{2}$ has a constant dc voltage, $\mathrm{V}_{\text {bias }}$ applied at its gate. Thus the signal voltage at the gate of $\mathrm{M}_{2}$ is zero and $\mathrm{M}_{2}$ is operating as a CG amplifier. Which is current Buffer.

Overall transconductance

$$
\begin{aligned}
\mathrm{g}_{\mathrm{m}} & =\frac{\mathrm{i}_{\mathrm{d}}}{\mathrm{~V}_{\mathrm{gs}}}=\left[\frac{\partial \mathrm{i}_{\mathrm{D}}}{\partial \mathrm{~V}_{\mathrm{GS}}}\right]=\frac{\mathrm{i}_{\mathrm{d}_{1}}}{\mathrm{~V}_{\mathrm{gs} \mathrm{~s}_{1}}} \\
& =\mathrm{g}_{\mathrm{m}_{1}}
\end{aligned}
$$

The overall (approximate) transconductance of the cascode amplifier is equal to the transconductance of common source amplifier $\mathrm{g}_{\mathrm{m}_{1}}$

## AC model of MOSFET

Let us find the output resistance $\mathrm{R}_{0}=\frac{1 \mathrm{~V}}{\mathrm{I}_{\mathrm{x}}}$

By KVL $\mathrm{V}_{\mathrm{gs} 2}+\mathrm{I}_{\mathrm{x}} \mathrm{r}_{01}=0$
$\mathrm{V}_{\mathrm{gs} 2}=-\mathrm{I}_{\mathrm{x}} \mathrm{r}_{01}----(1)$
By KVL
$-1+\mathrm{I}_{\mathrm{x}} \mathrm{r}_{02}-\mathrm{g}_{\mathrm{m}} \mathrm{r}_{02} \mathrm{~V}_{\mathrm{gs} 2}+\mathrm{I}_{\mathrm{x}} \mathrm{r}_{01}=0$
$-1+\mathrm{I}_{\mathrm{x}} \mathrm{r}_{02}+\mathrm{g}_{\mathrm{m} 2} \mathrm{r}_{02} \mathrm{I}_{\mathrm{x}} \mathrm{r}_{01}+\mathrm{I}_{\mathrm{x}} \mathrm{r}_{01}=0$
$\therefore I_{x}=\frac{1}{r_{01}+r_{02}+g_{m 2} r_{02} r_{01}} \approx \frac{1}{g_{m 2} r_{01} r_{02}}$
$\mathrm{R}_{0}=\frac{1}{\mathrm{I}_{\mathrm{x}}}=\mathrm{g}_{\mathrm{m} 2} \mathrm{r}_{01} \mathrm{r}_{02}$

Sol:

$\left(\frac{\mathrm{W}}{\mathrm{L}}\right)_{2}=2\left(\frac{\mathrm{~W}}{\mathrm{~L}}\right)_{1}$
$\mathrm{V}_{\mathrm{TH}}=1 \mathrm{~V}$ for both $\mathrm{M}_{1}$ and $\mathrm{M}_{2}$
For $\mathrm{M}_{2}$ to be in saturation:
$\mathrm{V}_{\mathrm{D}}>\mathrm{V}_{\mathrm{G}}-\mathrm{V}_{\mathrm{TH}}$
$3.3>2-1$
$3.3>1$
So $\mathrm{M}_{2}$ will be in saturation if it is ON .
For $\mathrm{M}_{1}$ to be in saturation:
$\mathrm{V}_{\mathrm{D}}>\mathrm{V}_{\mathrm{G}}-\mathrm{V}_{\mathrm{TH}}$
$\mathrm{V}_{\mathrm{X}}>2-1$
$\mathrm{V}_{\mathrm{X}}>1 \mathrm{~V}$ but if $\mathrm{V}_{\mathrm{X}}$ is more than $1 \mathrm{~V}, \mathrm{~V}_{\mathrm{GS} 2}$ becomes less than 1 V , Which means $\mathrm{M}_{2}$ will be off so $\mathrm{M}_{1}$ can not be in saturation.
Now, We can conclude that $\mathrm{M}_{1}$ is in triode and $\mathrm{M}_{2}$ is in saturation
$\mathrm{V}_{\mathrm{GS} 1}=2 \mathrm{~V}$
$\mathrm{V}_{\mathrm{DS} 1}=\mathrm{V}_{\mathrm{X}}$
$\mathrm{V}_{\mathrm{GS} 2}=2-\mathrm{V}_{\mathrm{X}}$
Now, $\mathrm{I}_{1}=\mathrm{I}_{2}$

$$
\begin{gathered}
\mu_{\mathrm{n}} \mathrm{C}_{\mathrm{ox}}\left(\frac{\mathrm{~W}}{\mathrm{~L}}\right)_{1}\left[\left(\mathrm{~V}_{\mathrm{GS} 1}-\mathrm{V}_{\mathrm{TH}}\right) \mathrm{V}_{\mathrm{DS} 1}-\frac{1}{2} \mathrm{~V}_{\mathrm{DS} 1}^{2}\right] \\
=\frac{1}{2} \mu_{\mathrm{n}} \mathrm{C}_{\mathrm{ox}}\left(\frac{\mathrm{~W}}{\mathrm{~L}}\right)_{2}\left(\mathrm{~V}_{\mathrm{GS} 2}-\mathrm{V}_{\mathrm{TH}}\right)^{2}
\end{gathered}
$$

$$
\begin{aligned}
& \mathrm{V}_{\mathrm{x}}-\frac{1}{2} \mathrm{~V}_{\mathrm{x}}^{2}=\left(1-\mathrm{V}_{\mathrm{x}}\right)^{2} \\
& 3 \mathrm{~V}_{\mathrm{x}}^{2}-6 \mathrm{~V}_{\mathrm{x}}+2=0 \\
& \mathrm{~V}_{\mathrm{x}}=0.42 \mathrm{~V},-1.58 \mathrm{~V}
\end{aligned}
$$

$V_{x}$ cannot be more than 1 V , since $\mathrm{M}_{2}$ will become off
So, $\mathrm{V}_{\mathrm{x}}=0.42 \mathrm{~V}$
